Math Notation

see conventional math notation

this note describes my own math notation, meant to solve inconsistencies in conventional math notation. it is not meant to be a fully formal system of mathematics; rather, it is built to be easy to understand and intuitive to use by mere humans.

this math notation obviously cannot be used to communicate ideas to people who do not know it, but it has made my own experience of using mathematics much more enjoyable. being able to use a single relatively well defined notation in various mathematics fields that conventially use their own made up notation has been invaluable

principles

- all equality operators check for equality and return a boolean, and it is implied that an expression on its own must evaluate to $\top$. this allows for boolean logic > operators to be applied on equalities explicitly as opposed informally
- sets are functions that return a boolean (sets are predicates). this way, boolean logic > operators and set operators are one and the same. other data structures that work similarly include vectors, matrixes, sequences, multisets, ordered pairs...
- some operators are identical but have different precedence as "more brackets means more explicit, but less brackets means less complex and less confusing"
- $\lfloor a \rfloor$ returns both positive and negative square roots ($\lfloor q2 \rfloor \equiv \ \because q$). the same is true for other reciprocals
- superscripts are modifiers (subscripts with special meanings). this distinction is extremely useful when working with forward propagation and backpropagation in neural networks, for example
- derivatives are not to be written as y', but rather as their complete form $\delta y - \delta x$. this makes calculus notation way more intuitive
- all indices start at 0, as they always should have
- rank polymorphism is supported over all operators

notation

also see trigonometric functions, hyperbolic functions and calculus notation

let:

- M be a matrix

- V be a <u>vector</u>
- P be an <u>ordered pair</u>
- M' be a <u>multiset</u>
- G be a <u>graph</u>
- E be an <u>expression</u>
- x be a <u>variable</u>
- f be a <u>function</u>
- A be a <u>sequence</u>
- B be a <u>series</u>
- a, b be any mathematical objects
- A, B be any mathematical objects with rank greater than 1
- n, i be <u>natural</u> numbers
- b be a <u>boolean</u>
- ω be any <u>number</u>
- $\circ$ be any <u>operator</u>

operator descriptions

notation	description	notes
$a : b$	addition or disjoint union	
$a \cdot b$	subtraction	
$\because$ and $\therefore$	$\pm$ and $\mp$	
$a \mathbin{\lrcorner} b$ and $a \mid b$	multiplication	
$a\text{-}b$ and $a - b$	division	
$[a]b$	exponentiation	represents a power by convention
$a[b]$	exponentiation	represents an exponential by convention
$\lfloor a \rfloor b$	b th root of a	$b = 2$ if b is omitted
$\lceil a \rceil b$	base-b <u>logarithm</u> of a	$b = e$ if b is omitted
$x \to E$	<u>function</u> literal	$f = x \to E \equiv f \leftarrow x = E$
$f \leftarrow E$	<u>function</u> application	uncommon, shorthand preferred
$a = b$	equality	numerical equality by convention
$a < b$ and $a > b$	strict inequality	
$a \leq b$ and $a \geq b$	non-strict inequality	

notation	description	notes
$a \wedge b$	logical AND or $\min$ function	
$a \vee b$	logical OR or $\max$ function	
$a \mathbin{/} b$	logical difference	$a \wedge b = \bot$
$a \equiv b$	equality	logical equality by convention
$a \times b$	nonequality	also serves as logical XOR
$a \vdash b$	implication, <u>set > subset</u>	a implies b, b for all a
$a \dashv b$	reverse implication, <u>set > superset</u>	a for all b, b implies a
$a_0 \circ a_1 \circ \cdots a_n$	with $n = 3$, $a_0 \circ a_1 \circ a_2 \circ a_3$	step size is $\because$ 1 if $a_1 \circ$ is omitted
$a_0 \cdots a_n$	with $n = 3$, a_0, a_1, a_2, a_3	step size is $\because$ 1 if a_1 is omitted
$f \mathbin{\vdots} a \circ b$	$f\,a \circ f\,b$	
$f \mathbin{\vdots} x \to a$	the <u>limit</u> of f as x approaches a	
x_{sub}	the <u>variable</u> x with a subscript sub	
V^n	the n th component of V	
A^i	the i th element of A	
B^i	the i th element of B	
$M^{\langle i,j \rangle}$	the i, j th element of M	uncommon, shorthand preferred
P^b	the b th element of P	
$S\,a$	whether a is element of S	
$M'\,a$	the number of elements a in M'	
$G\,a$	whether vertex a is in G	
$G^{\langle a,b \rangle}$	the number of edges from a to b in G	uncommon, shorthand preferred

shorthands

shorthand	definition	notes
$a \nvdash b$, $a \neq b$, $a \nleq b$, $a \nless b$...	$/(a \vdash b)$, $/a = b$, $/a \leq b$, $/a < b$...	
$x\omega$	$[x]\omega$	
ax	$a{\mid}x$	

shorthand	definition	notes
$f\,E$	$f \leftarrow E$	common, longhand discouraged
$x\,y \to E$	$x \to y \to E$	
$\langle\,\rangle$	$\langle\langle\,\rangle\rangle$	see empty set
$(\,)$	$((\,))$	see multiset
V^x, V^y, V^z	V^0, V^1, V^2	
$M^{i,j}$	$M^{\langle i,j \rangle}$	common, longhand discouraged
$M^{i,}$	the i th row of M	
$M^{,j}$	the j th column of M	
$P = \langle f, t \rangle$	$P^\perp = f \wedge P^\top = t$	see ordered pair
$S = \langle\langle a \cdots b \rangle\rangle$	$S\,x \equiv x = a \vee \cdots x = b$	see set
$V = (a \cdots b)$	$V^0 = a \wedge \cdots V^n = b$	see vector in rn
$M' = ((1,2,2,2,3,3))$	multiset literal	see multiset
$M = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$	matrix literal	see matrix
$x \to (a < x < b)$	the interval from a to b	
$A \circ B$	$x \to A\,x \circ B\,x$	see rank polymorphism
$A \circ B$	$A\,x \circ B\,x$ for all x	why not $\wedge A \circ B$ #think
$\circ A$	the reduce function of A with $\circ$	
$A \dot\circ B$	the outer product of A and B with $\circ$	
$\delta y - \delta x$	the derivative of y with respect to x	δ should be used instead of d
$\int y \mid \delta x$	the antiderivative of y with respect to x	δ should be used instead of d

constants

constant	definition	notes
$\varnothing$	*undefined*	see improved expression evaluation
$\top$	logical true	
$\bot$	logical false	

constant	definition	notes
τ	the ratio of the circumference of a [circle](#) to its radius	using π is discouraged
e	Euler's constant	see [eulers constant](#)
ι	$\lfloor \cdot 1 \rfloor$	see [imaginary](#), using i is discouraged
Π	the [pi function](#)	using fact is discouraged
$\#$	the size of the range of a [function](#)	
ψ	the [multiset](#) of prime factors of a [natural](#)	see [psi function in mat2348](#)

operator properties

in order of high to low precedence

#todo fix asymmetry between $=\neq>\geq<\leq$ and $\wedge \vee \dashv \vdash \ \equiv \times$

operator	associativity	unary identity	unary description
$()\ \langle\rangle\ []\ \ x\ x^i_a$			
$[]\ \sqcup\ \sqcap$			
ι -	left	1	inverse
$\delta\ \sin\ \#\ \leftarrow$	right-ish		
$\therefore\ \cdot\ \ddots\ \therefore$	left	0	negation
$\vert\ -$	left	1	inverse
$\int\ \vdots\ \cdots\ \rightarrow\ \bmod$	right-ish		
$=\neq>\geq<\leq$	AND	0	is (not) 0
$/$	left	$\top$	[boolean logic](#) NOT
$\wedge\ \vee$	left		
$\dashv\ \vdash$	left		
$\equiv\ \times$	AND	$\top$	[boolean logic](#) NOT
$,$			

> **note**: above,
>
> - x represents [variable](#)s
> - x^i_a represents subscripts and superscripts
> - $\leftarrow$ represents [function](#) application

- → represents [function](#) literals
- ⌈⌉ represents [matrix](#) literals

> **note**: unary [operator](#)s have identical precedence to their binary counterparts, but are right associative

definition let ∘ be an [operator](#) with *AND associativity*. then,

$$a \circ b \circ c \circ \cdots \;\equiv\; a \circ b \wedge b \circ c \wedge c \circ \cdots$$

variable scope

[variable](#) [scope](#) is currently entirely context dependent. this is know to cause occasional issues, such as with [derivative](#)s: $\delta f\, x - \delta x$ could represent both the [derivative](#) of f with respect to x in the general sense, or the [derivative](#) of f with respect to x **at the point** x

examples

description	in this [math notation](#)	in [conventional math notation](#)
the [quadratic formula](#)	$x = \cdot b : \lfloor b2 \cdot 4ac \rfloor - 2a$	$x_{1,2} = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
definition of [complex](#) numbers	$\mathbb{C}x \equiv x = a : b\iota \wedge \mathbb{R}a \wedge \mathbb{R}b$	$\mathbb{C} = \{a + bi : a, b \in \mathbb{R}\}$
the [gaussian function](#)	$G^\sigma\, p = -\lfloor \tau\sigma 2 \rfloor - e[:p2 - 2\sigma 2]$	$G(x, y, \ldots) = \dfrac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{x^2 + y^2 + \ldots}{2\sigma^2}}$
[limit](#) form of a [derivative](#)	$f\, x \cdot f\, a - x \cdot a \;\vdots\; x \to a$	$\lim\limits_{h \to 0} \dfrac{f(x + h) - f(x)}{h}$
definition of factorials	$\mathrm{fact}\, n = 1 \mid \cdots n$	$n! = \prod\limits_{i=1}^{n} i$
the resonant [frequency](#) of an LC circuit	$f = -\tau \lfloor LC \rfloor$	$f = \dfrac{1}{2\pi\sqrt{LC}}$
definition of the [dot product](#)	$: xy$	$x \cdot y = \sum\limits_{i=1}^{n} x_i y_i$
definition of the [outer product](#)	$x \mid y$	$(x \otimes y)_{i,j} = x_i \times y_j$
definition of the [cartesian product](#)	$x \mathbin{;} y$	$x \times y = \{(x, y) \mid x \in X \text{ and } y \in Y\}$
definition of [vector in rn > magnitude](#)	$\lfloor : v2 \rfloor$	$\lvert v \rvert = \sqrt{x^2 + y^2 + \ldots}$ with $v = (x, y, \ldots)$

description	in this math notation	in conventional math notation
definition of set difference	$A/B \equiv A \wedge \times B$	$A \setminus B = \{x \in A : x \notin B\}$
the p-adic > absolute value	$|n|^p = -p[\psi \, n \, p]$	not really doable in a concise way without using plain English

definition of the boolean logic > implication / set > subset / set > superset / quantifier > universal quantifier in this math notation: $a \vdash b \equiv /a \vee b$ and $a \dashv b \equiv a \vee /b$

in set theory, if U is a set > subset of V and V is a set > subset of U, then V is U. in this math notation: $(U \, x \vdash V \, x) \wedge (U \, x \dashv V \, x) \equiv U = V$

the negation of a boolean logic > implication in this math notation: $B \vdash C \times B \, / \, C$

in conventional math notation: $\neg(B \rightarrow C) = B \wedge \neg C$ or $(a \in B \rightarrow a \in C) \iff a \notin B \setminus C$ or $B \subset C \iff \forall a \in C, a \notin B$
